Temperature versus elevation relationships for Puerto Rico^{1, 2}

Megh R. Goyal, Eladio A. González and Carmela Chao de Báez³

ABSTRACT

Relationships among mean daily maximum-, mean daily minimum-, mean daily average-, absolute highest-, absolute lowest temperature ($^{\circ}\text{C}$) versus elevation (m) were determined for January through December for Puerto Rico. These relationships were found to be linear, $Y = A + BX$. The coefficient of correlation varied from -0.43 to -0.96. Examples are presented to estimate potential evapotranspiration (PET) and to develop PET model as a function of incident solar radiation and elevation.

RESUMEN

Relación entre temperatura y elevación en Puerto Rico

La relación entre las temperaturas ($^{\circ}\text{C}$) media diaria, máxima diaria, mínima diaria, más alta y más baja para cada mes contra la elevación (m) se determinaron de enero a diciembre para Puerto Rico. Se encontró que estas relaciones son lineales. El coeficiente de correlación varió de -0.43 a -0.96.

INTRODUCTION

Water consumptive use by crops in any particular location is probably affected more by temperature, which for long-time periods is a good measure of solar radiation, than any other factor. Abnormally low temperatures may retard plant growth and unusually high temperatures may produce dormancy. Temperature is one of the most dynamic properties of weather and is subject to daily and seasonal changes. Irrigation planning can be delayed or underestimated if temperature data for various locations in a particular locality is not available.⁴

The objective of this study was to establish relationships among monthly temperature ($^{\circ}\text{C}$) and elevation (m) for Puerto Rico with avail-

¹With temperature data from climatology to the U.S. No. 86-45; Puerto Rico and U.S. Virgin Islands.²Y = A + BX, where Y = Temperature, °C; X = Elevation, m; A and B = Regression coefficients; R² = coefficient of determination; r = negative coefficient of correlation. All regression coefficients were significant at P = 0.01.

able temperature data. We also estimated missing temperature data with these relationships.

MATERIALS AND METHODS

Available temperature data⁵ and Publication No. 86-45 of the Weather Bureau, U.S. Department of Commerce⁶ were used to determine relationships among monthly temperature (Y) and elevation (X) for Puerto Rico with linear regression analysis. We used these relationships to estimate missing mean maximum temperature (TMAX), mean minimum temperature (TMIN) and mean average temperature (T) for January through December. Thirty-nine locations were considered. These weather stations⁶ were Aceituna, Adjuntas, Barceloneta 2NNW, Bayamón Hato Tejas, Cabo Rojo, Calero Camp, Caonillas Villalba, Carite Plant I, Cataño, Central San Francisco, Coamo Dam, Ensenada, Guajataca Dam, Guayabal Reservoir, Guayanilla, Gurabo, Indiera Baja, Jájome Alto, La Fe, Maricao, Maricao Fish Hatchery, Matrullas Dam, Maunabo 1SW, Mora Camp, Naguabo 6W, Paraíso, Peñuelas Salto Garzas, Puerto Real, Río Blanco Lower, Río Blanco Upper, San Lorenzo Espino, San Sebastián, Santa Isabel 3NW, Santa Rita, Toa Baja Constancia, Toro Negro Plant 2, Villalba, Yabucoa 1NNE, Yauco 1S.

RESULTS AND DISCUSSION

Table 1 shows mean daily maximum-, mean daily minimum-, mean daily average-, absolute highest- and lowest temperature ($^{\circ}\text{C}$) versus elevation (m) relationships for January through December. It was found that temperature is negatively correlated with elevation. The relationships were linear. All regression coefficients were significant at $P=0.01$.

For various months, the coefficient of correlation varied from 0.89 to 0.96 for mean daily average temperature; 0.80 to 0.89 for mean daily maximum temperature; 0.67 to 0.79 for mean daily minimum temperature; 0.64 to 0.80 for highest temperature and 0.43 to 0.60 for lowest temperature. The coefficient of determination (R^2) varied from 0.78 to 0.92 for mean daily average temperature; 0.64 to 0.79 for mean daily maximum temperature; 0.44 to 0.63 for mean daily minimum temperature; 0.41 to 0.64 for highest temperature and 0.19 to 0.36 for lowest temperature. These coefficient of correlations imply that these relationships gave best estimates of mean daily temperature for January through December compared to highest and lowest monthly temperatures.

TMAX and TMIN, T estimates are indicated in tables 2, 3 and 4.

Table 1.

^aLocations of these weather stations are identified in J. Agric. Univ. P.R., 70 (4): 267-75. Elevation (m) of weather stations is above sea level.

^bThese numbers correspond to weather station number in table 1 of J. Agric. Univ. P. R., 70 (4): 267-75.

Example I: The Fortuna Substation, Juana Díaz, P. R. is located at an elevation of 12 m and is identified as station No. 7292-Ponce 4E by U.S. Department of Commerce.⁶ Estimated monthly temperature for this location:

Table 1 indicates linear relationships between temperature (Y) and elevation (X), $Y = A + B X$. With values of A, B from table 1 and $X = 12$, temperatures are calculated and shown in table 5. The observed temperature values are also given in table 5.

Example II: Estimate potential evapotranspiration (PET) for January with information in table 1.

Hargreaves and Samani⁴ indicated the following relationships to estimate PET:

$$\text{PET} = 0.0023 \times R_a \times (T + 17.8) \times (\text{TMAX} - \text{TMIN})^{0.5} \dots /1/$$

$$\text{PET} = 0.0135 \times R_s \times (T + 17.8) \dots /2/$$

where, PET is potential evapotranspiration (mm per day); R_a is extraterrestrial radiation (mm per day); T is mean daily average temperature in °C, TMAX and TMIN are mean daily maximum and minimum temperatures in °C. R_a for Puerto Rico (18°N) is 11.68 for January, 13.02 for February, 14.65 for March, 15.83 for April, 16.30 for May, 16.38 for June, 16.38 for July, 15.80 for August, 15.23 for September, 13.62 for

Annual	26.1	25.7	31.3	30.8	20.9	20.5	36.0	35.3	14.8	15.1

¹ Weather station No. 7292 PONCE 4E at an elevation of 21 m.

² Temperature values were estimated using relationships between temperature (°C) and elevation (m) given in table 1. Observed temperature is from climatology of the U.S. No. 86-45—Puerto Rico and U.S. Virgin Islands.⁶

October, 12.11 for November, 11.29 mm per day for December, respectively. R_s is incident solar radiation.

PET was calculated with equations /1/ and /2/, values of R_a , T, TMAX and TMIN. PET values are given below:

Equation /1/: PET = 2.4 mm/day for January

Equation /2/ and $R_s = 6.9$: PET = 3.4 mm/day for January

Example III: Develop PET model as a function of incident solar radiation (R_s) and elevation (X) with temperature versus elevation relationships in table 1. Temperature (T, °C) and elevation (X, m) is defined by the following relationship:

$$T = A + B \times r X \dots \text{/3/}$$

where A, B are regression coefficients defined by table 1 for January through December. Combining equations /2/ and /3/, we obtain:

$$\text{PETNEW} = 0.0135 \times R_s \times (A + B \times X + 17.8) \dots \text{/4/}$$

Rearranging:

$$\text{PETNEW} = R_s \times (0.0135 \times A + 0.0135 B \times X + 17.8 \times 0.0135) \dots \text{/5/}$$

or

$$\text{PETNEW} = R_s \times ((0.2403 + 0.0135 \times A) + (0.0135 \times B) X) \dots \text{/6/}$$

or

$$\text{PETNEW} = R_s \times (A^1 + B^1 \times X) \dots \text{/7/}$$

where, $A^1 = 0.2403 + 0.0135 A$, and $B^1 = 0.0135 B$. For January through December, equation /7/ reduces to:

$$\text{PETNEW}_i = R_s \times (A_i^1 + B_i^1 \times X) \dots \text{/8/}$$

where $i = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12$ for January, February, March, April, May, June, July, August, September, October, November, December, respectively. Introducing values of A_i and B_i from table 1, we obtain values of A_i^1 and B_i^1 and equation /8/ reduces to the following equations:

$$\text{January: PETJAN} = R_s \times (0.563085 - 8.8695 \times 10^{-5} \times X) \dots \text{/9/}$$

$$\text{February: PETFEB} = R_s \times (0.56268 - 8.8425 \times 10^{-5} \times X) \dots \text{/10/}$$

$$\text{March: PETMAR} = R_s \times (0.569295 - 8.721 \times 10^{-5} \times X) \dots \text{/11/}$$

$$\text{April: PETAPR} = R_s \times (0.580635 - 8.7075 \times 10^{-5} \times X) \dots \text{/12/}$$

$$\text{May: PETMAY} = R_s \times (0.594 - 8.8965 \times 10^{-5} \times X) \dots \text{/13/}$$

$$\text{June: PETJUN} = R_s \times (0.602775 - 8.559 \times 10^{-5} \times X) \dots \text{/14/}$$

$$\text{July: PETJUL} = R_s \times (0.605205 - 8.7075 \times 10^{-5} \times X) \dots \text{/15/}$$

$$\text{August: PETAUG} = R_s \times (0.60723 - 8.5725 \times 10^{-5} \times X) \dots \text{/16/}$$

TABLE 6.—*C*-Continued

Weather station (elevation, m) ¹	Parameter ²	Units	Jan	Feb	Mar	April	May	June	July	Aug	Sept	Oct	Nov	Dec
84. Utuado (129.9)	TMAX	°C	29.7	30.1	31.1	31.5	31.8	32.8	32.9	32.8	32.6	31.5	30.1	
	TMIN	°C	14.4	14.5	14.5	16.6	18.2	18.7	18.9	18.7	18.2	17.5	15.6	
	TAVG	°C	22.1	22.3	22.8	24.0	25.0	25.8	27.9	25.8	25.4	24.5	22.9	
	PETHS1	mm/day	4.18	4.75	5.58	5.89	5.92	6.18	6.20	5.92	5.72	5.12	4.41	
		mm/month	129.6	133.0	173.0	176.7	183.5	185.4	192.2	183.5	171.6	158.7	132.3	
													124.6	

Caution: These values are only for Puerto Rico.

¹Locations of these weather stations are identified in table 1 and isohyetal charts in J. Agric. Univ. P. R., 70 (4): 267-75. Elevation (m) of weather station is above sea level.

²TMAX = Mean daily maximum temperature °C, TMIN = Mean daily minimum temperature °C, T or TAVG = Mean daily average temperature °C, PETHS1 = Potential evapotranspiration defined by equation /1/, mm/day or mm/month.

*These numbers correspond to weather stations in table 1 and isohyetal charts in J. Agric. Univ. P. R., 70 (4): 267-75.

$$\text{September: PETSEP} = R_s \times (0.60534 - 8.694 \times 10^{-5} \times X) . /17/$$

$$\text{October: PETOCT} = R_s \times (0.600075 - 8.667 \times 10^{-5} \times X) . /18/$$

$$\text{November: PETNOV} = R_s \times (0.588465 - 8.694 \times 10^{-5} \times X) . /19/$$

$$\text{December: PETDEC} = R_s \times (0.57483 - 8.964 \times 10^{-5} \times X) . /20/$$

$$\text{Annual: PETANUAL} = R_s \times (0.58779 - 8.748 \times 10^{-5} \times X) . /21/$$

where PETNEW_i = Potential evapotranspiration in mm per day, R_s = Incident solar radiation in mm per day and X = elevation in m. Equations /9/ to /21/ are only valid for Puerto Rico.

Equations /9/ to /21/ are valid only for Puerto Rico and for $4.5 \leq X \leq 900$. Eq. /1/ can not be used to develop equations /9/ to /21/ because coefficient of correlation between (TMAX - TMIN) versus elevation is very poor (table 1) for all months. This is explained by the fact that R_s varies at all locations in Puerto Rico. When the temperature data are not available, equations /9/ to /21/ are useful because elevation of a location is readily available from property records, U.S. Weather Bureau, U.S. Geological Survey, USDA-SCS, or another local government agency in Puerto Rico. It is not possible to combine equations /9/ to /21/ into one equation as the relationships among temperature versus elevation are different for January through December.

Example IV: Estimate PET for 36 locations in Puerto Rico with the Hargreaves and Samani model.

Hargreaves and Samani⁴ indicated following relationship:

$$\text{PET} = 0.0023 \times R_a \times (T + 17.8) \times (\text{TMAX} - \text{TMIN}^{0.5}) .. /1/$$

R_a for Puerto Rico is given in example II. T, TMAX and TMIN (°C) are from Climatology of the United States No. 86-45 for Puerto Rico.⁵

⁶ PET for 36 locations in Puerto Rico was estimated with equation /1/ and temperature data. These PET values are shown in table 6.
