

# Innovative image-based techniques to characterize Cayo Enrique reef

Adrienne Mundorf, Research Assistant

Carlos Rivera Borrero, Graduate Research Assistant

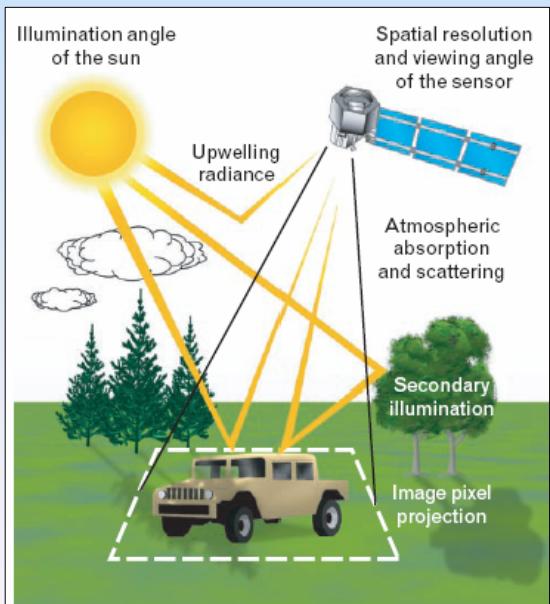

Shawn Hunt, Electrical Engineering Professor

# Contents

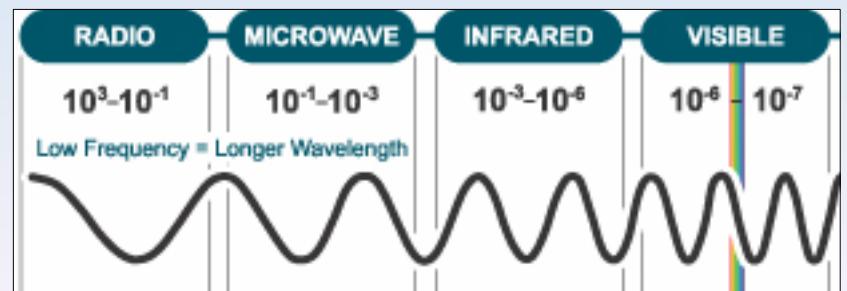

- Remote sensing background
- Coral reef background
- Classification
- GPS/GER measurements
- GER analysis
- Hyperspectral camera
- Future work

# Remote Sensing

1. Radiance from sun
2. Reflected off earth's surface
3. Reflected wavelengths recorded by satellite
  - Field of view
  - Spatial resolution
  - Viewing angle

- Visible region  
(400 to 700 nanometers)
- Reflected infrared region  
(700 to 3000 nanometers)
- Near infrared  
(help distinguish vegetation/deep water)
- Spectral signature
- Spectral resolution

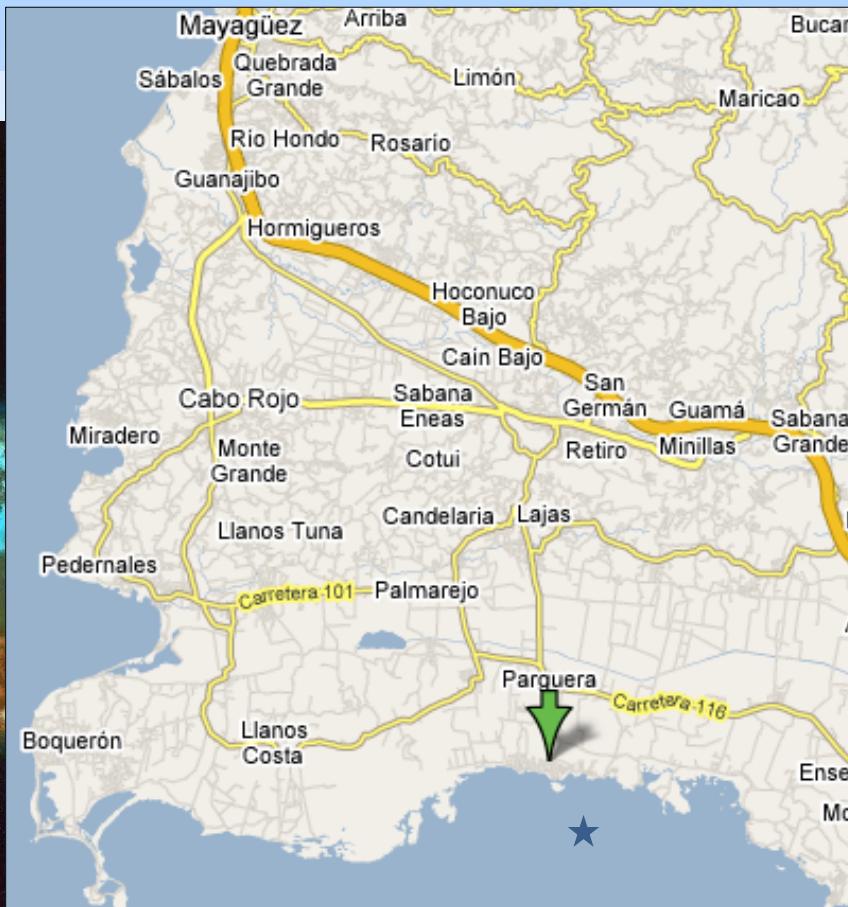

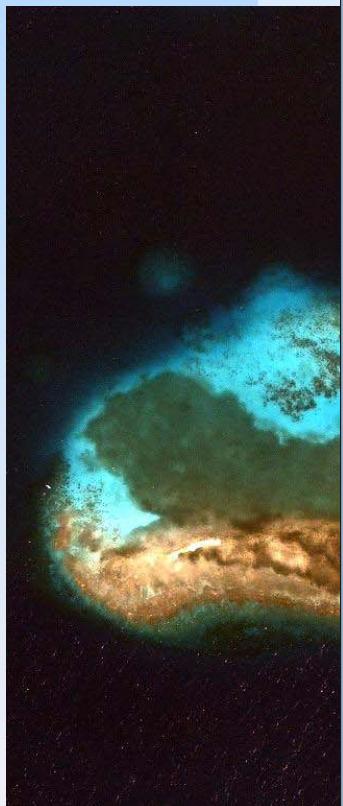

(4)

# Obstacles in Remote Sensing

- Materials in atmosphere
- Scattering (water vapor)
- Light absorbed on the way back to sensor
- Secondary illumination
- Image distortion (sun/sensor angle)
- Clouds
- Seasonal changes

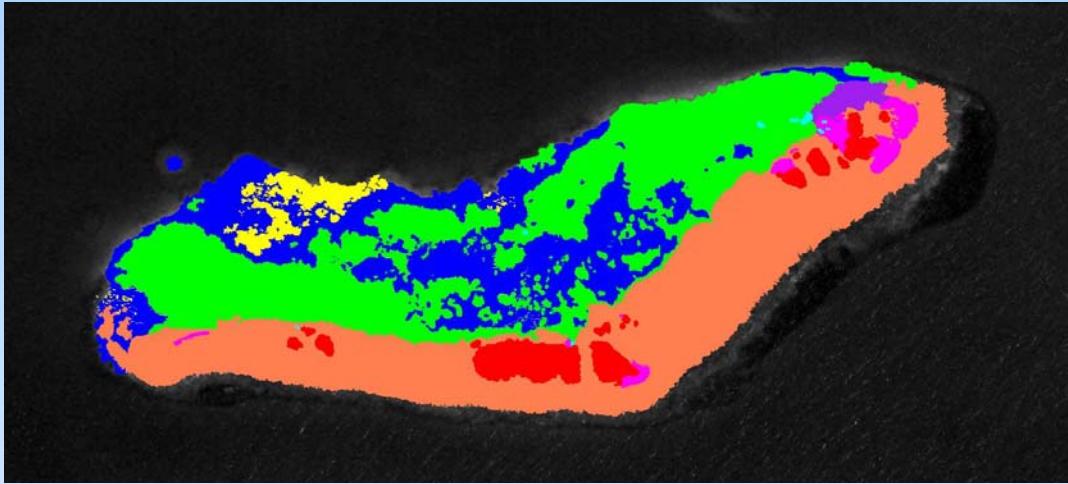

# Cayo Enrique

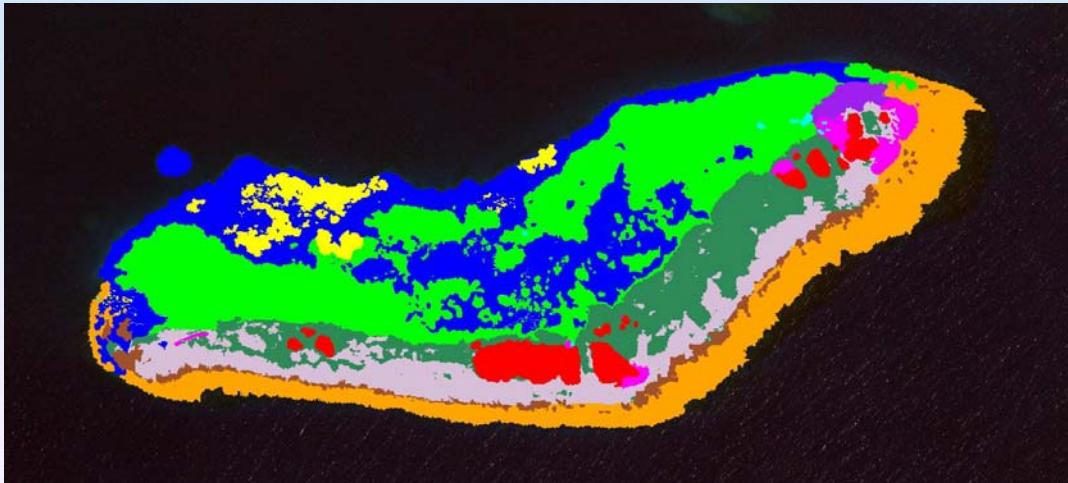

Digital in ©2007 Google

2006

# Classification

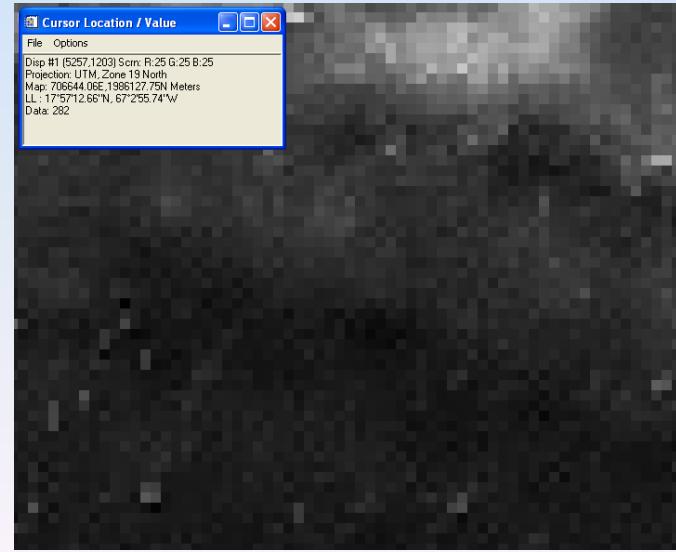

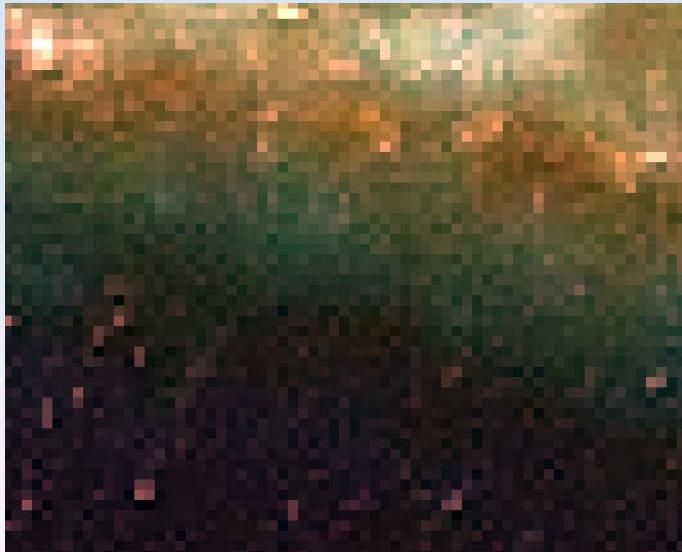

*Classification completed previously, completed by Carlos Rivera*

*Classification completed in this part of the project*

# Classifying Techniques

- Use of NIR bands
- Using a single band
- Ground-truthing

# Visiting the Reef

# GPS and GER

## GPS Pathfinder® Pro XRS receiver

Used to record exact location

(3)

## GER 1500 Spectroradiometer

Used to record intensity of energy reflected for different wavelengths

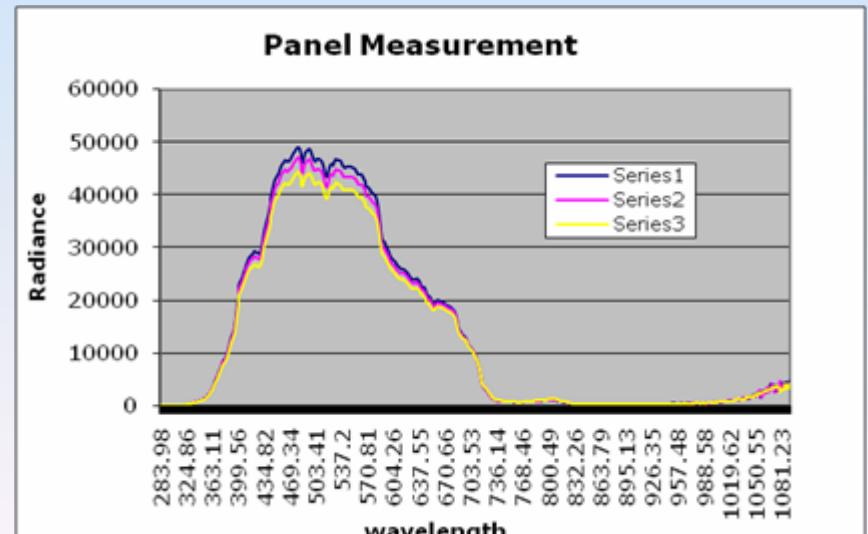

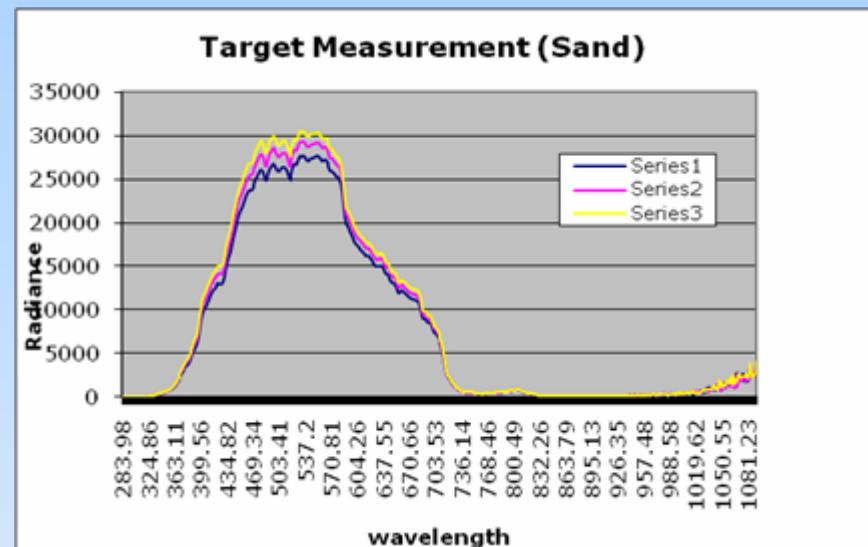

+

=

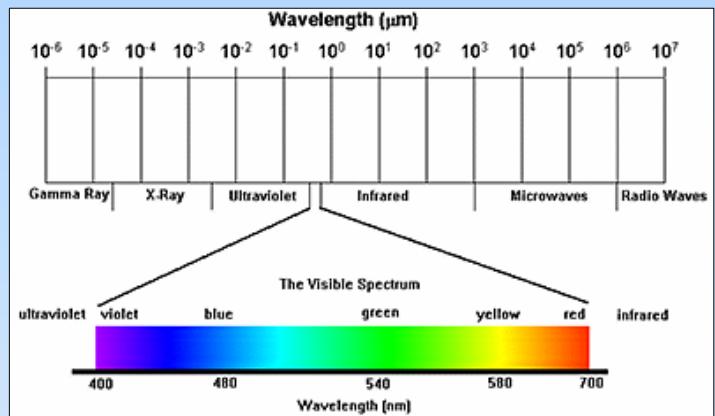

# Spectral Analysis

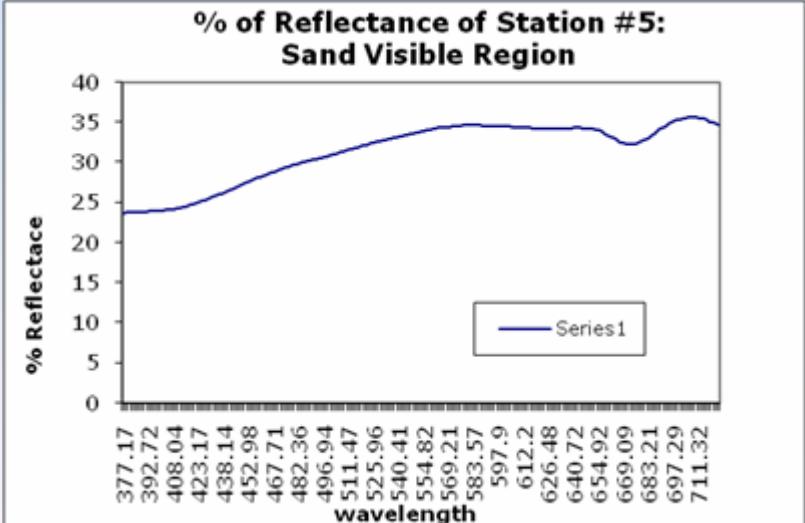

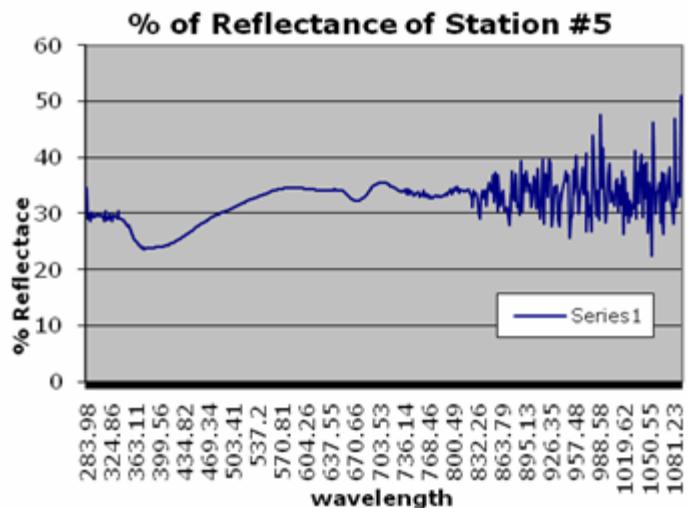

# Spectral Analysis Continued...

% Reflectance =

$$\frac{\text{Avg. target measurements} * 100}{(\text{Avg. panel measurements} * 2)}$$

(5)

# Hyperspectral Camera

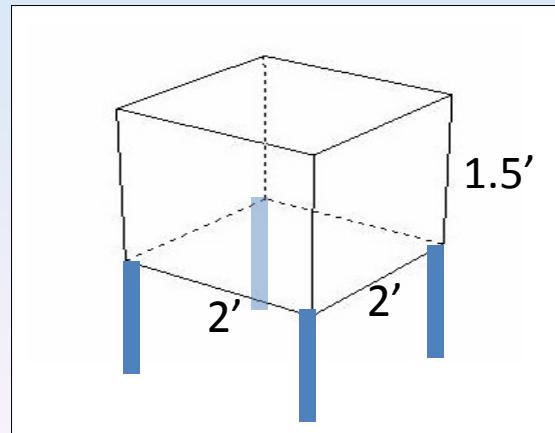

## SOC 700

Used to record images with many spectral bands

## Plexi-glass box

Used to block waves obstructing camera's field of view

# The general idea of the box:

# Future Work

- Periodic digital image collection
- Reef classification
- Continue ground-truthing
- More measurements
  - Hyperspectral
  - Spectroradiometer
- *Preserve marine life*

## Acknowledgements:

Funding provided by Eisenhower Transportation Grant.

Equipment from Electrical Engineering and Marine Sciences dept. at UPRM.

Supported in part by CenSSIS, the Center for Subsurface Sensing and Imaging Systems, under the Engineering Research Centers Program of the National Science Foundation (Award Number EEC-9986821).
